

UI and Feature differences between the enterprise and personal version

Overall:

Enterprise is for users within organizations to discover their own lookalike domains, report them with the intent to take them down. More overall features, technical terms,

Personal is for users on their own personal devices to discover lookalike domains, evaluate URLs and notify organizations of their lookalikes, not to take them down themselves. The UI is simpler, more intuitive, and easier for someone without technical knowledge.

Domain lookalike finder

Enterprise	Personal
• Know what domain provider registered ○ Use provider in logic as some providers are known to host more malicious domains • Full logic displayed with technical terms • Reporting tool • May need another product version for IT team and users in org (End user vs IT/Admin)	• Simpler design, easier to use and understand ○ Features used in logic are not disclosed • Simple risk rating • Reporting only to legitimate organization not reporting domain on their behalf

Trend of providers housing malicious domains: <https://www.spamhaus.org/reputation-statistics/registrars/domains/>

Reporting tool

Enterprise	Personal
• Use which domain provider in reporting tool ○ Tailoring reporting mechanism to a specific company is better than generic ○ Every company probably has it's own reporting procedure • Enterprise End-User report to IT team ○ End users of organization reporting will alert their own IT team	• One-Click Report to Brand button ○ Pre-filled email template to notify the real brand. ○ Contact list including popular supported brands (ex. Google, Microsoft, Apple, etc.) ○ Contact list to also include Canadian government contacts due to recent trends

URL checker (Chrome extension) (Need to determine if feasible for project)

Enterprise	Personal
• Employees/regular users in organization ○ Only get protective features (real-time warnings, risk indicators, block/warn on suspicious URLs) • IT / Cyber-security team ○ Full control and visibility (policy configuration, log access, allow/block lists, view employees that have accessed a suspicious domain, etc.)	• Alerts when user is on a website that is rated malicious ○ Advising user to avoid inputting personal info, passwords, payment info ○ If a website already has pending reports, alert user (may require cloud implementation) • Alerts based on risk score ○ Low risk: advise user to always be careful when entering info ○ Medium risk: advise user against entering info ○ High risk: Alert user to not put any info ○

Emails of legitimate brands

Google: brandprotect@google.com

Microsoft: brandabuse@microsoft.com

Apple: trademark@apple.com

PayPal: brandprotection@paypal.com

Amazon: brand-enforcement@amazon.com

Meta/Facebook/Instagram: ip@fb.com

Include Canadian government emails, since recent incidents target them
